

Attorneys and Scientists in the Courtroom: Bridging the Gap

Attorneys and Scientists in the Courtroom: Bridging the Gap

**Metrology: A Knowledge Base for
Communication and Understanding**

Truth

“The ultimate mission of the system upon which we rely to protect the liberty of the accused as well as the welfare of society is to ascertain the factual truth.”

Commonwealth of Northern Mariana Islands v. Bowie, 243 F.3d 1109, 1114 (9th Cir. 2001)

The Goal of Forensic Science: To Facilitate the Discovery of Truth

1. ENLISTING THE METHODS OF SCIENCE IN THE INVESTIGATION OF CRIMES.
2. PROVIDING EVIDENCE FOR USE IN COURT THAT HAS BEEN TESTED BY SCIENTIFIC METHODOLOGY.

Metrology as Knowledge Base and Language: Enhancing Science, Communication, Understanding and Law

Epistemic Basis

- 1) Forensic science.
- 2) Communication and evaluation of forensic science by legal professionals.
- 3) Jurisprudence governing forensic science evidence.

Why Epistemology?

Forensic Science

“The law’s greatest dilemma in its heavy reliance on forensic evidence...concerns the question of whether—and to what extent—there is *science* in any given ‘forensic science’ discipline.”_{NAS}

Forensic Science

“Adherence to scientific principles is important for concrete reasons: they enable the reliable inference of knowledge from uncertain information—exactly the challenge faced by forensic scientists.” NAS 217.

Why Epistemology?

Legal Professionals

The “judicial system is encumbered by...judges and lawyers who generally lack the scientific expertise necessary to comprehend and evaluate forensic evidence in an informed manner.”

Legal Professionals

Judges and lawyers must become familiar with the basic tenants and language of science. Professional competence requires the ability to actively participate in the analysis, understanding and communication of science in the courtroom. The floor cannot simply be ceded to the claims of experts.

Why Epistemology?

Jurisprudence

If judges have insufficient understanding of science, gatekeeping decisions cannot satisfy ultimate goals of justice system of being non-arbitrary and facilitating discovery of factual truth in subsequent cases.

Jurisprudence

“In this age of science we must build legal foundations that are sound in science as well as in law.” Justice Stephen Breyer in, *Reference Manual on Scientific Evidence* 4 – 8 (2nd ed. 2000).

Outcomes consistent with scientific reality require scientific evidence that conforms to the standards and criteria to which scientists themselves adhere. Black, 239 Science 1508, 1512 (1988).

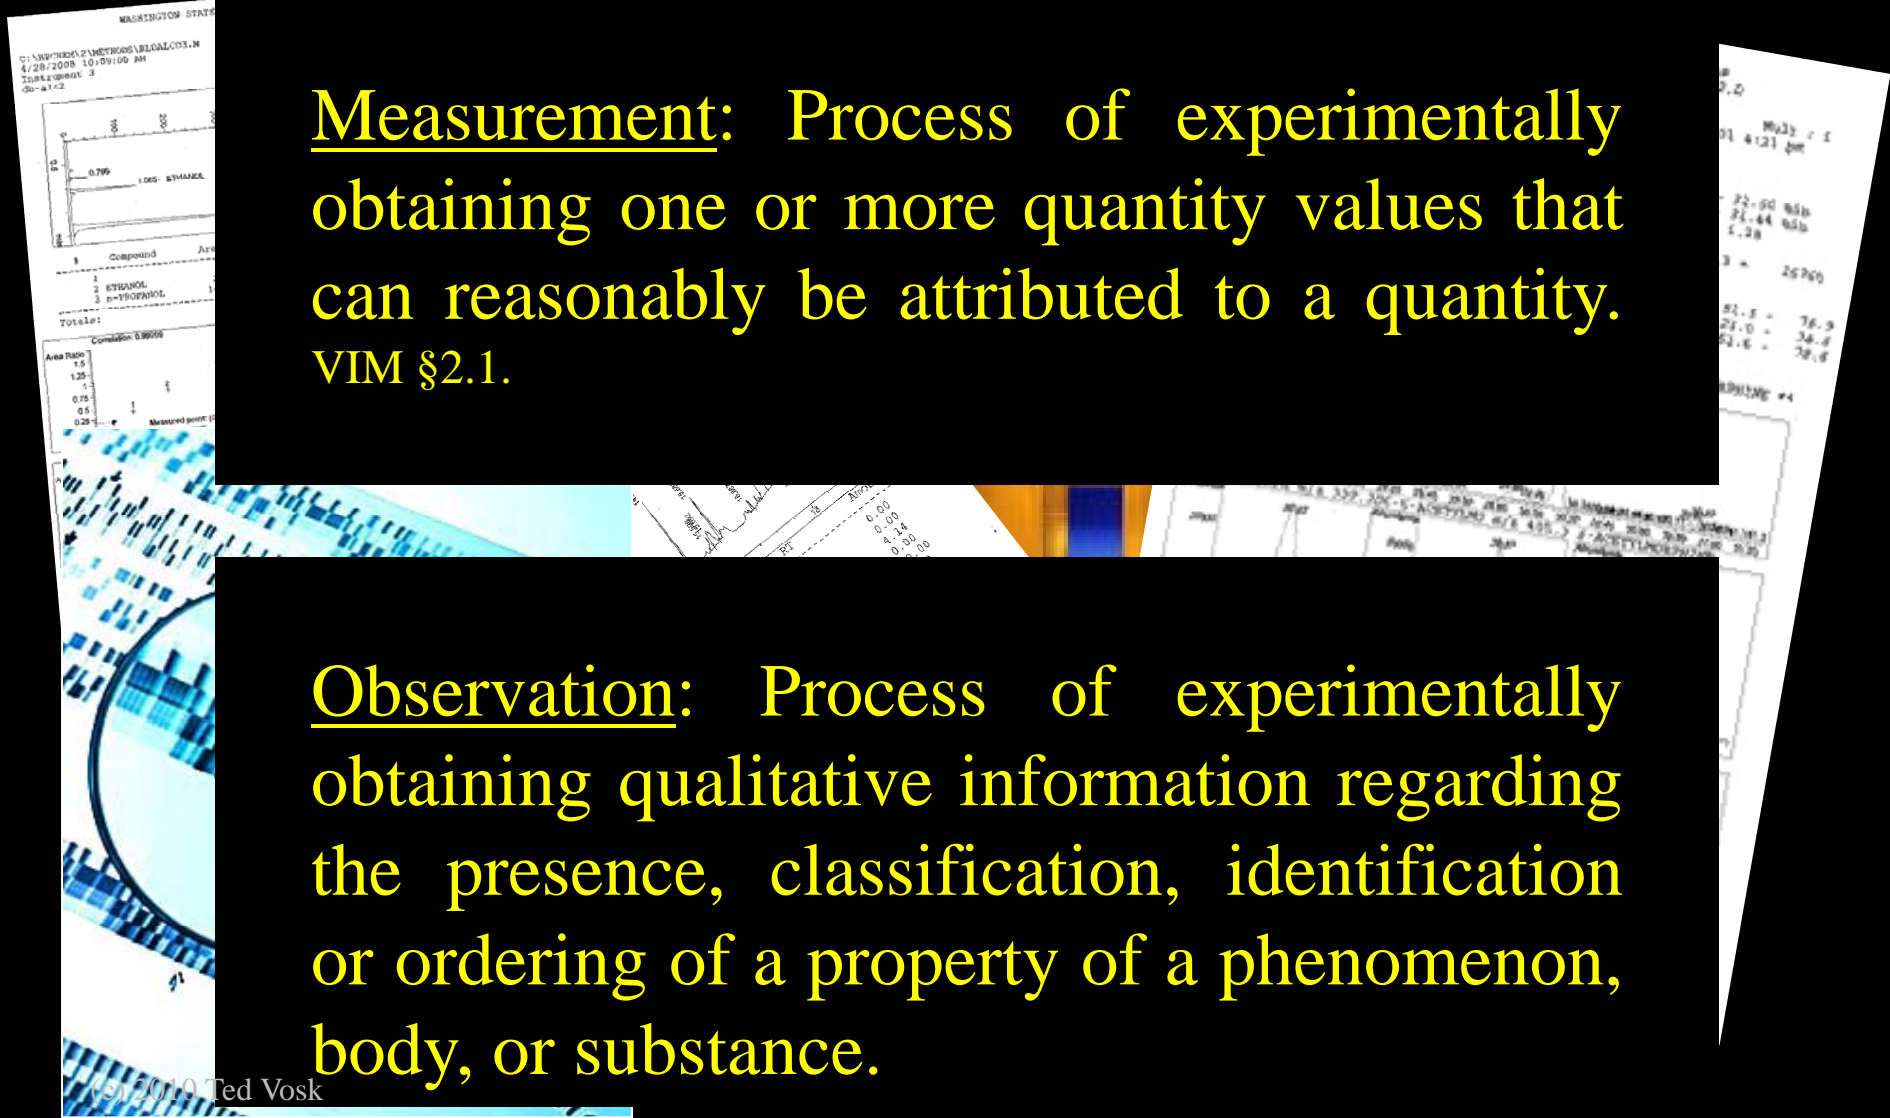

Scientific Knowledge

“Scientific method refers to the body of techniques for investigating phenomena, acquiring new knowledge, or correcting and integrating previous knowledge. It is based on gathering *observable, empirical* and *measurable* evidence subject to *specific principles of reasoning*.” Sir Isaac Newton, Principia Mathematica.

Observable, Empirical and Measurable

The background of the slide features a collage of various scientific and technical documents. On the left, there is a document titled 'WASHINGTON STATE' with a date '4/28/2008 10:09:00 AM' and a file path 'C:\NAP\CHROM\2\METHODS\LIB\CALC03.M'. It includes a chromatogram with peaks labeled '1 DES-ETHANOL' and '2 ETHANOL', and a table of 'Area Ratio' values. On the right, there is a document titled 'RECEIPT #4' with a date '4/28/2008 10:09:00 AM' and a file path 'C:\NAP\CHROM\2\METHODS\LIB\CALC03.M'. It includes a table of 'Area Ratio' values and a 'Total' value. The documents are partially obscured by the text boxes.

Measurement: Process of experimentally obtaining one or more quantity values that can reasonably be attributed to a quantity. VIM §2.1.

Observation: Process of experimentally obtaining qualitative information regarding the presence, classification, identification or ordering of a property of a phenomenon, body, or substance.

Fundamental Principles of Reasoning

Metrology

Fundamental Principles of Reasoning

“Science of measurement and its application.”

International vocabulary of metrology (VIM) JCGM 200 §2.2 (2008)

(c) 2010 Ted Vosk

“[I]f science is measurement, then without metrology there can be no science.” Lord Kelvin, 1886.

Subjects of Metrology

Weights & Measures:

Reference standards

Traceability

Validation:

Methods

Reliability

Quality Assurance:

Calibration

Standard Operating Procedures (SOPs)

Meas./Obs. interpretation:

Reporting results

Error & Uncertainty

Scientific Standards:

General & specific

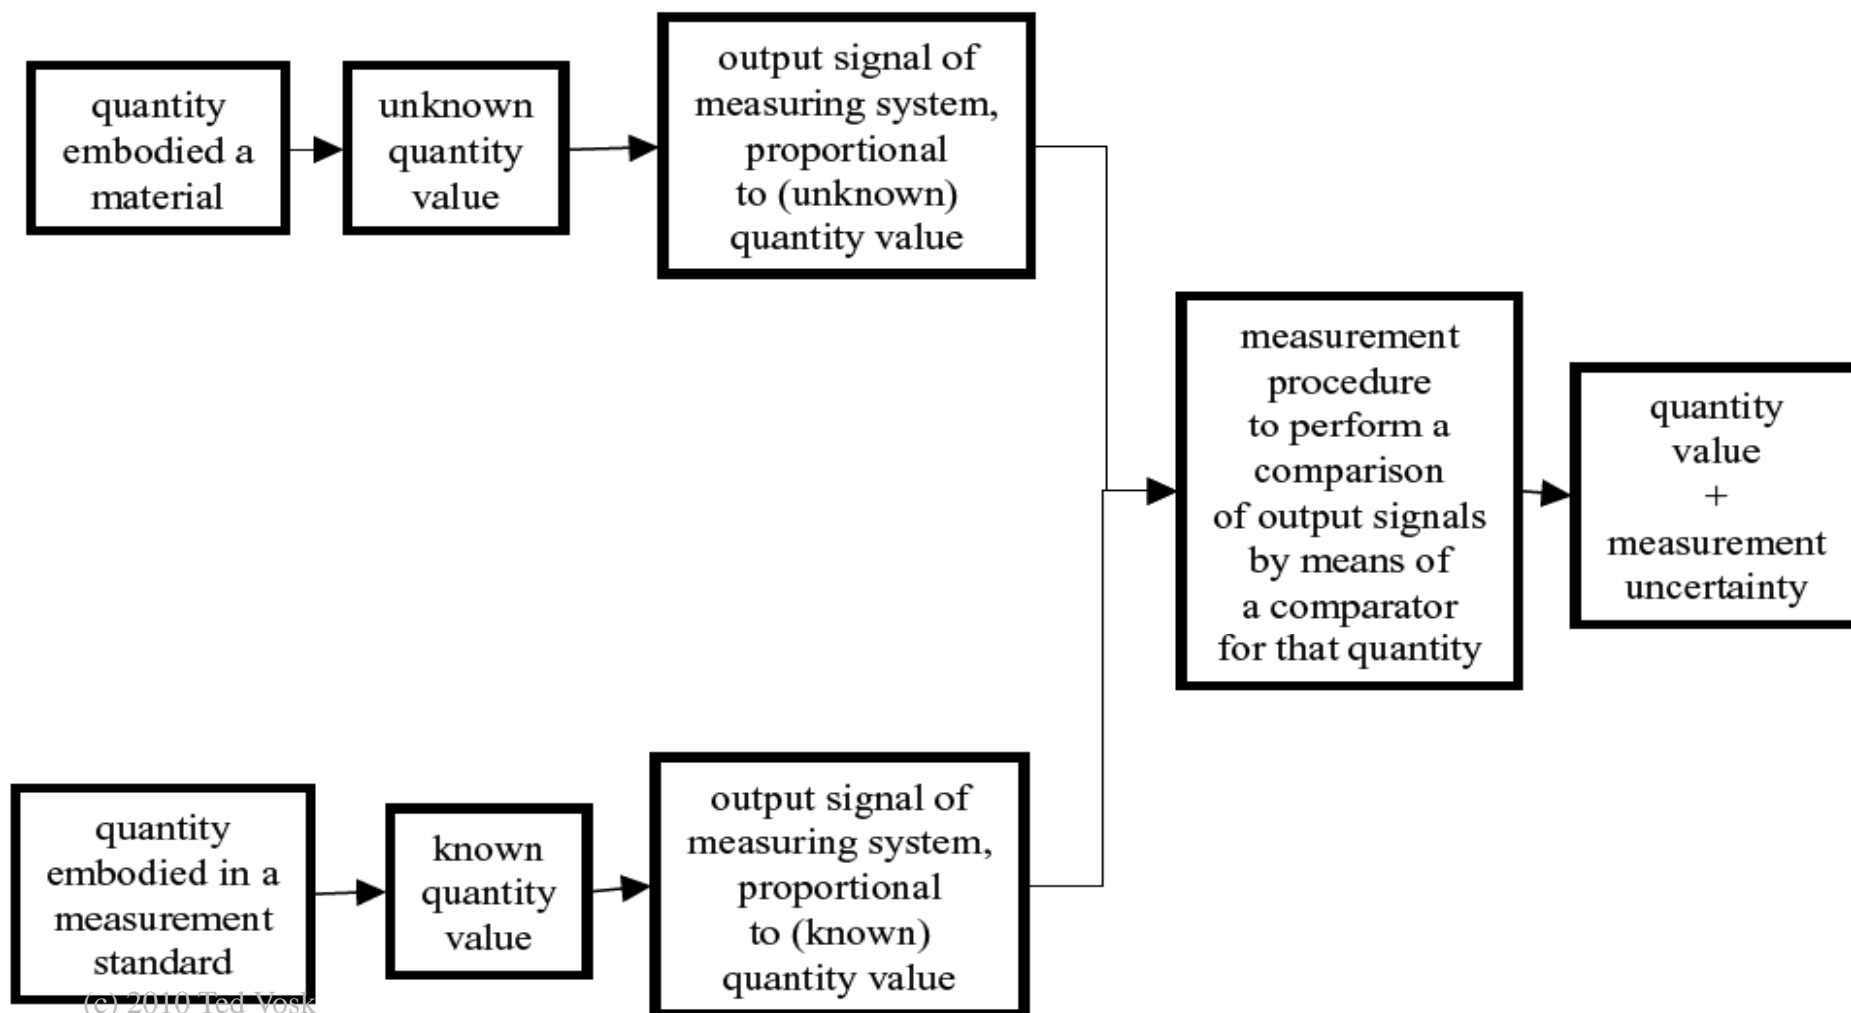

Accreditation

The Measurement Process

“Measurement implies comparison of quantities.”

VIM § 2.1

Reference Standards

Object, material, substance or process one or more of whose properties are well enough established to be used for instrument calibration, assessment of method, assignment of values and/or classification.

CONCENTRATION/ IDENTITY

MASS

(c) 2010 Ted Vosk

LENGTH

Reference Standards: The Cubit

Cubit: Length from forearm from bent elbow to tip of middle finger.

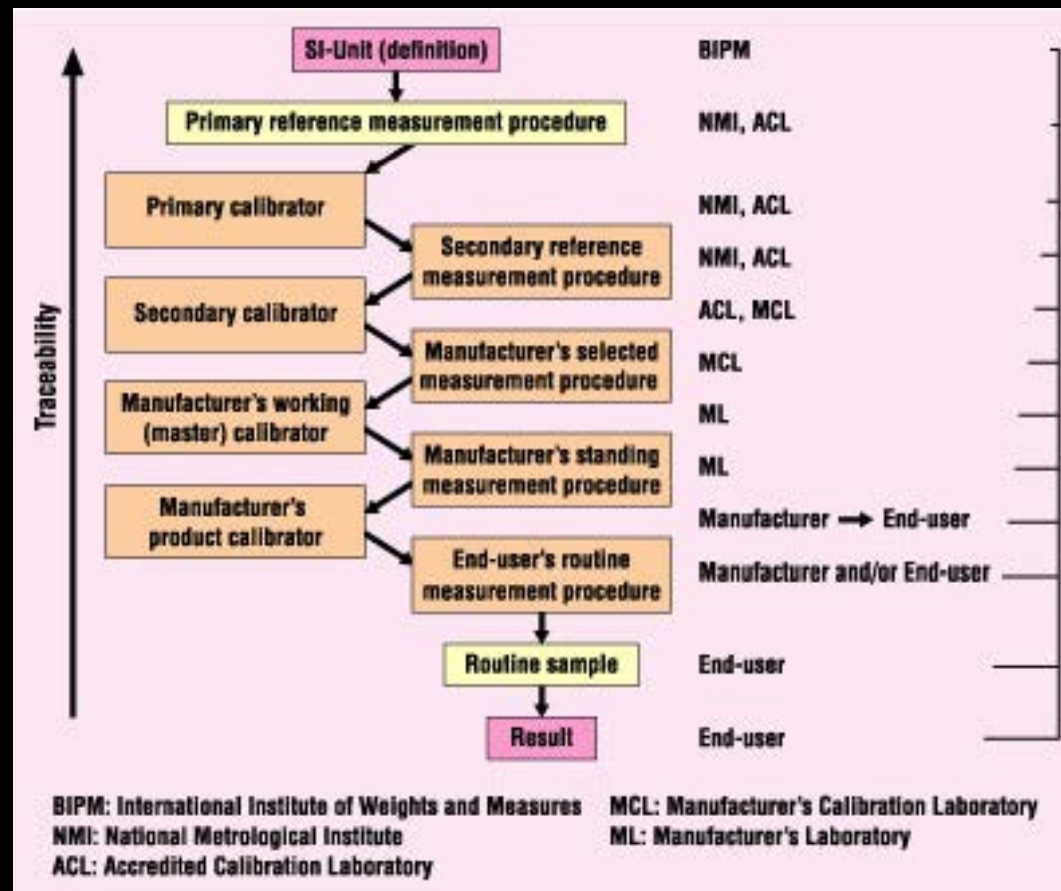

Reference Standards: The Cubit

Egyptians utilized the cubit as the standard measure of length for construction.

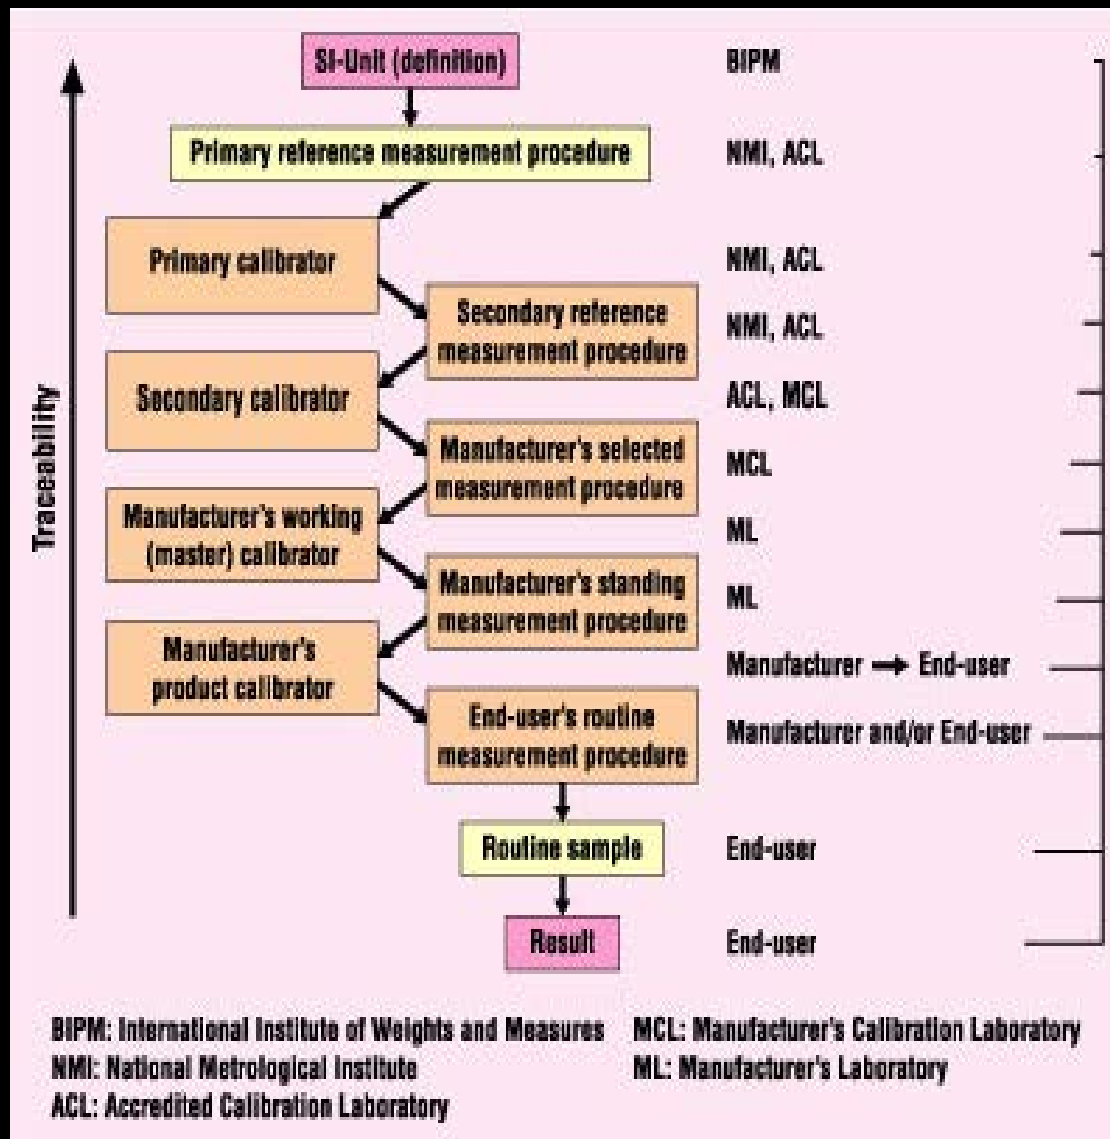

Traceability

Traceability: “Property of a measurement result whereby the result can be related to a reference through a documented unbroken chain of calibrations, each contributing to the measurement uncertainty.” VIM § 2.41.

Traceability: The Cubit

Traceability: The Cubit

Using cubit Egyptians were able to construct massive pyramids accurate to within 4.5 inches!

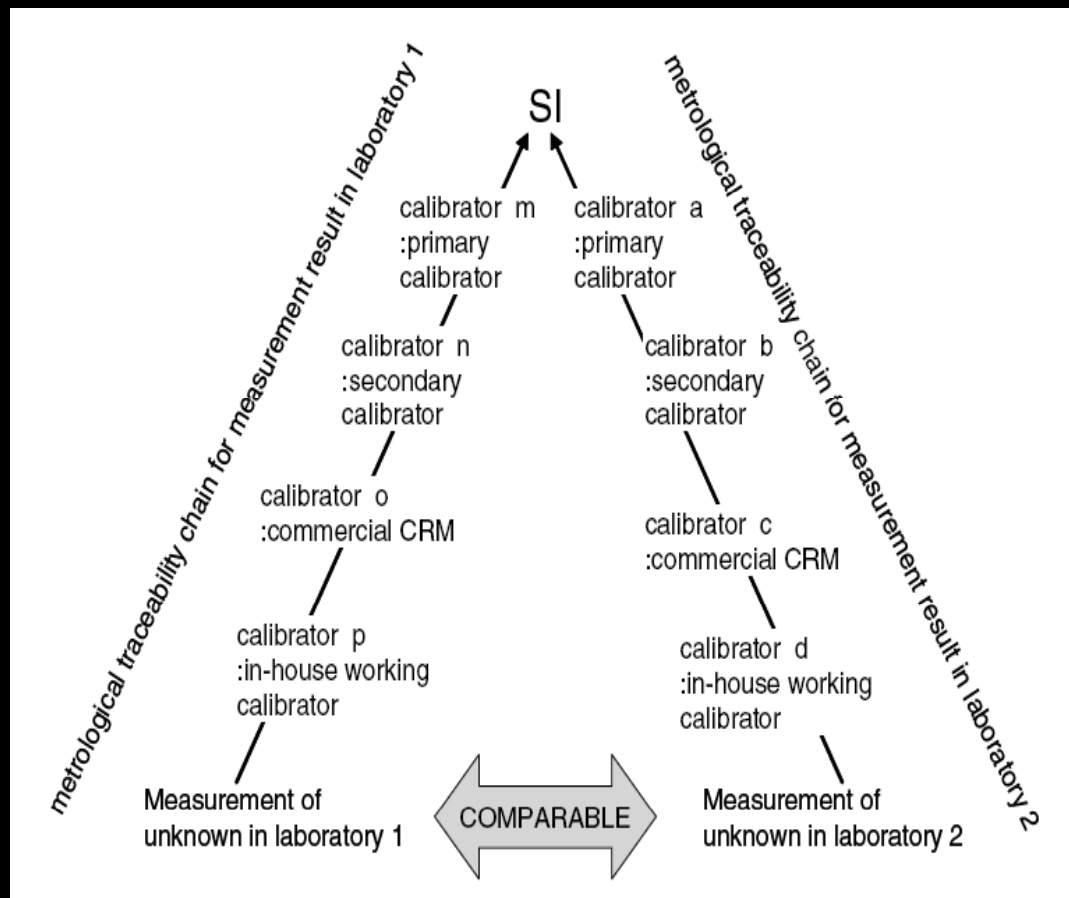

Comparability: The Cubit

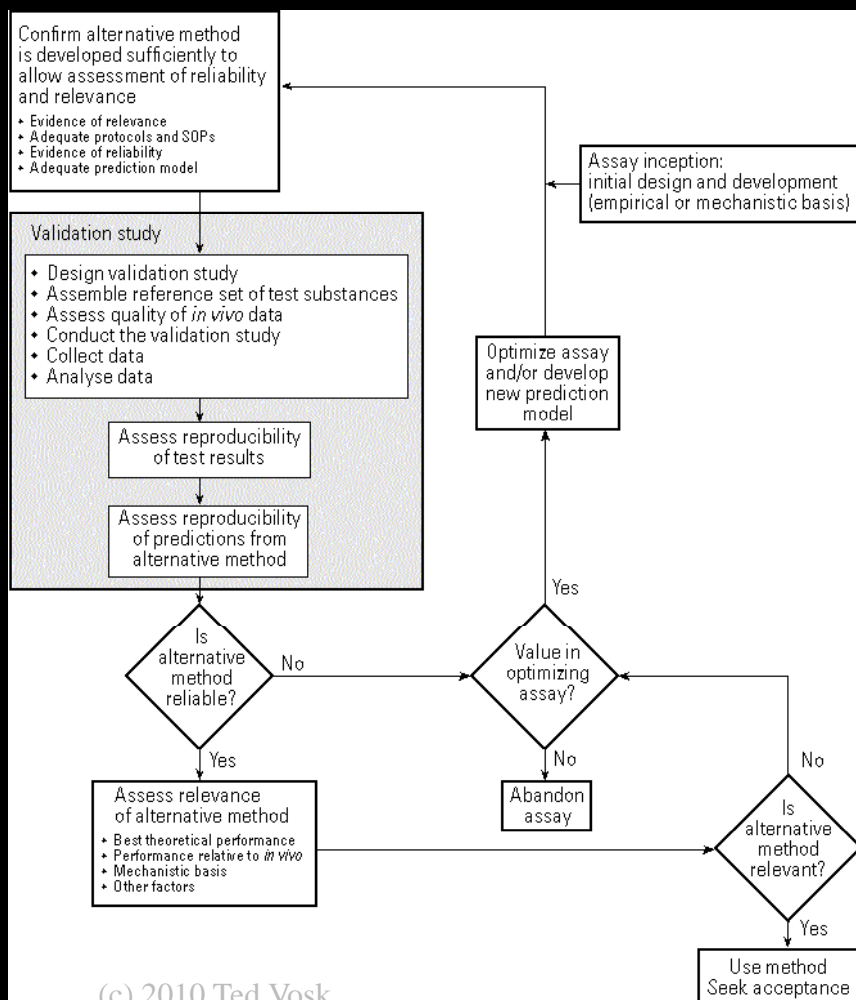

Traceability & Comparability

Traceability to documented reference standards is necessary for the comparison of measurement results.

Validation

A central component of science is the validation of methods to determine their ability to answer questions posed and their limitations.

GENERAL PAPER

Analytical Methods Committee

Evaluation of analytical instrumentation. Part XXII Instrumentation for liquid chromatography/mass spectrometry

Validation

“To confirm the validity of a method or process for a particular purpose...validation studies must be performed.” NAS 113

Validation

The most important information from a validation study is:

- (1) Can a method discriminate a hypothesis from its alternative;
- (2) Can a method measure a quantity of interest;
- (3) Sources and magnitude of error/uncertainty;
- (4) Consequences of error/uncertainty on the decisions relying upon method.

Validation Method Reliability

	Test Result A	Test Result $\neg A$	
A	True Positive N_{TP}	False Negative N_{FN}	$N_{TP} + N_{FN}$
$\neg A$	False Positive N_{FP}	True Negative N_{TN}	$N_{FP} + N_{TN}$
	$N_{TP} + N_{FP}$	$N_{FN} + N_{TN}$	N

Validation

Method Reliability

	Test Result A	Test Result ¬A	
A	True Positive N_{TP}	False Negative N_{FN}	$N_{TP} + N_{FN}$
¬A	False Positive N_{FP}	True Negative N_{TN}	$N_{FP} + N_{TN}$
	$N_{TP} + N_{FP}$	$N_{FN} + N_{TN}$	N

SENSITIVITY: Percent confirming a true condition.

$$S_e = [N_{TP} / (N_{TP} + N_{FN})]$$

SPECIFICITY: Percent rejecting a false condition.

$$S_p = [N_{TN} / (N_{FP} + N_{TN})]$$

FALSE NEGATIVE (TYPE I ERROR) RATE: Percent rejection of true condition.

$$FNR = [N_{FN} / (N_{TP} + N_{FN})]$$

FALSE POSITIVE (TYPE II ERROR) RATE: Percent failure to reject false condition.

$$FPR = [N_{FP} / (N_{FP} + N_{TN})]$$

POSITIVE PREDICTIVE VALUE: Percent indicating condition true that are correct.

$$P_{pv} = [N_{TP} / (N_{FP} + N_{TP})]$$

NEGATIVE PREDICTIVE VALUE: Percent indicating condition false that are correct.

$$N_{pv} = [N_{TN} / (N_{FN} + N_{TN})]$$

Quality Assurance: Calibration

Procedure by which it is ensured that a given instrument can yield a traceable results with known level of uncertainty.

Calibration data

Concentration of standards	Instrument readings
0	0
2.5	5.23
5	10.31
7.5	15.04
10	19.55

Application to unknowns

Readings of the unknowns	Calculated concentration	Estimated error (σ)	Estimated % relative error
5.0000	2.4300	0.12	4.88%
10.0000	4.9855	0.14	2.85%
20.0000	10.0965	0.21	2.10%

	value	Error (σ)
Slope	1.9566	0.0352
Intercept	0.2456	0.2156

Calibration:

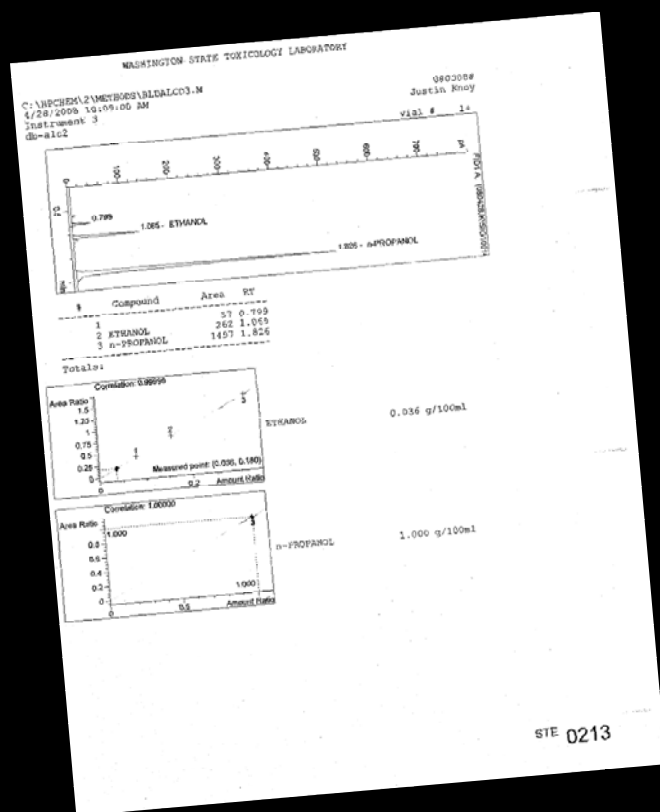

Range of Calibration

“Standards should never be used in an extrapolative mode. They should always bracket the measurement range. No measurement should be reported at a value lower or higher than the lowest or highest standard used to calibrate the measurement process.” NIST, *Standard Reference Materials: Handbook for SRM Users*, NISTSP 260-100, 6 (1993).

Result Interpretation

Quantitative & Qualitative

A woman with blonde hair, wearing a white lab coat, is seated at a desk in a laboratory setting. She is pointing her right index finger at a computer monitor. The monitor displays a software interface with multiple horizontal timelines or Gantt charts, showing various colored bars and markers, likely representing experimental schedules or data analysis. The background shows a typical lab cubicle with a bulletin board containing papers and a calendar.

“It is scientific only to say what is more likely and what is less likely.” Richard Feynman.

(c) 2010 Ted Vosk

Richard Feynman.

Reporting Results

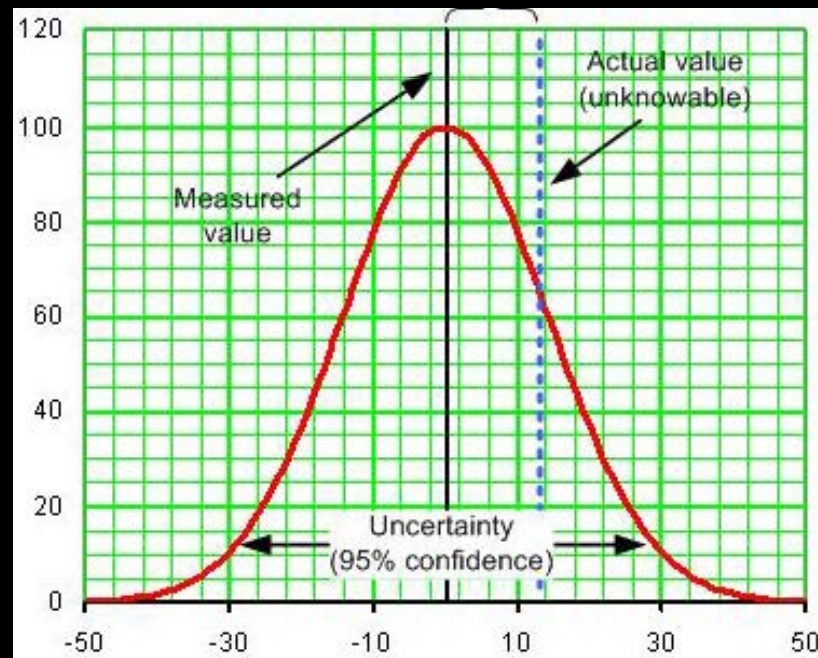

“Forensic reports, and any courtroom testimony stemming from them, must include clear characterizations of the limitations of the analyses, including measures of uncertainty in reported results and associated estimated probabilities where possible.” NAS 186.

(c) 2010 Ted Vosk

Quantitative Results & Uncertainty

UNCERTAINTY: For a given measurement result, there is not one value but an infinite number of values dispersed about the result that are consistent with the observations and data and one's knowledge of the physical world, and that with varying degrees of credibility can be attributed to the measurand. GUM §5.2

Quantitative Results & Uncertainty

UNCERTAINTY: Characterization of the dispersion of values assignable to a measurand based on the information available and taking into account all sources of error associated with the measurement or test process.

Quantitative Results & Uncertainty

Coverage Interval & Expanded Uncertainty ($U = k\mu_c$)

Define an interval about a measurement result expected to encompass a large fraction of the distribution of values that can reasonably be attributed to the measurand with a given level of confidence.

Coverage factors for reporting expanded measurement uncertainty / TABLE 1

Confidence interval	<i>k</i> coverage factor
68.26%	1.000
90%	1.645
95%	1.960
95.45%	2.000
99%	2.576
99.73%	3.000

Expanded measurement uncertainty of measurement x / FIGURE 1

Bayesian Methods

Baye's Theorem

$$p(H \mid I) \propto p(H) p(I \mid H)$$

where

$p(H \mid I)$ = Posterior probability: Probability of H given result I.

$p(H)$ = Prior probability: Probability of (degree of belief in) H prior to result I.

$p(I \mid H)$ = Probability of result I if H true.

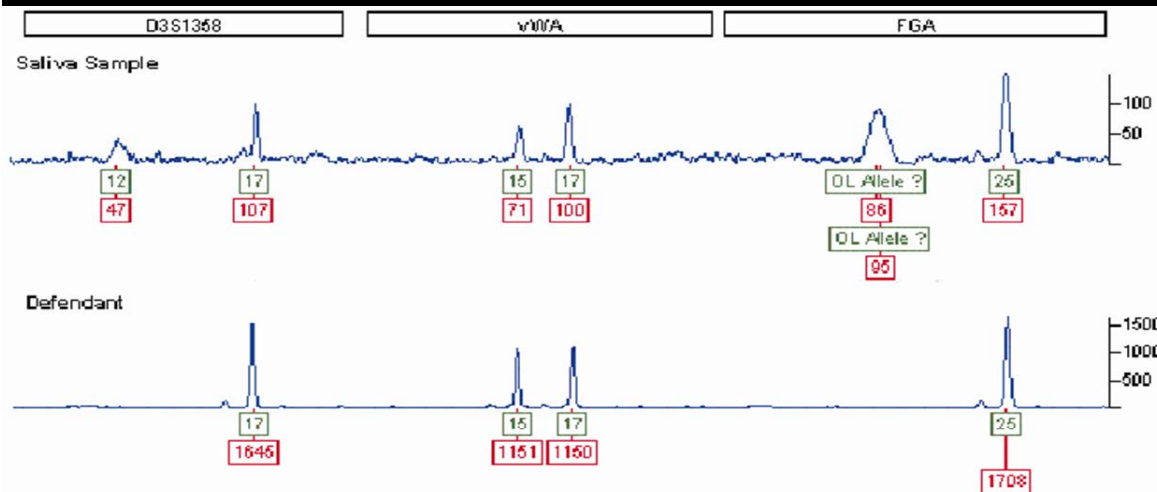

Likelihood Ratio

$$LR = p(I \mid H) / p(I \mid \neg H)$$

The Measurand

Measurand: quantity intended to be measured

Scientific Standards

“Standards provide the foundation against which performance, reliability, and validity can be assessed. Adherence to standards reduces bias, improves consistency, and enhances the validity and reliability of results.” NAS 201.

Metrology Standards

Metrological standards are established by consensus, based on the consolidated results of science, technology and experience, and approved by a recognized body. ISO Guide 2 § 3.2.

ISO 17025

“This International Standard specifies the general requirements for the competence to carry out tests and/or calibrations...[and] is applicable to all organizations performing tests and/or calibrations.” ISO 17025 § 1.1 – 1.2.

Metrology and the Jurisprudence of Science

“[I]n order to qualify as ‘scientific knowledge,’ an inference or assertion must be derived by the scientific method.” *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, 509 U.S. 579, 590 (1993)

Metrology & Legal Principles

A key question is whether a scientific method has been tested. Scientific evidence “must be supported by appropriate validation.” Daubert.

Forensic Analysis of Explosives Using Isotope Ratio Mass Spectrometry (IRMS)—Part 1: Instrument Validation of the DELTA^{plus}XP IRMS for Bulk Nitrogen Isotope Ratio Measurements

Metrology & Legal Principles

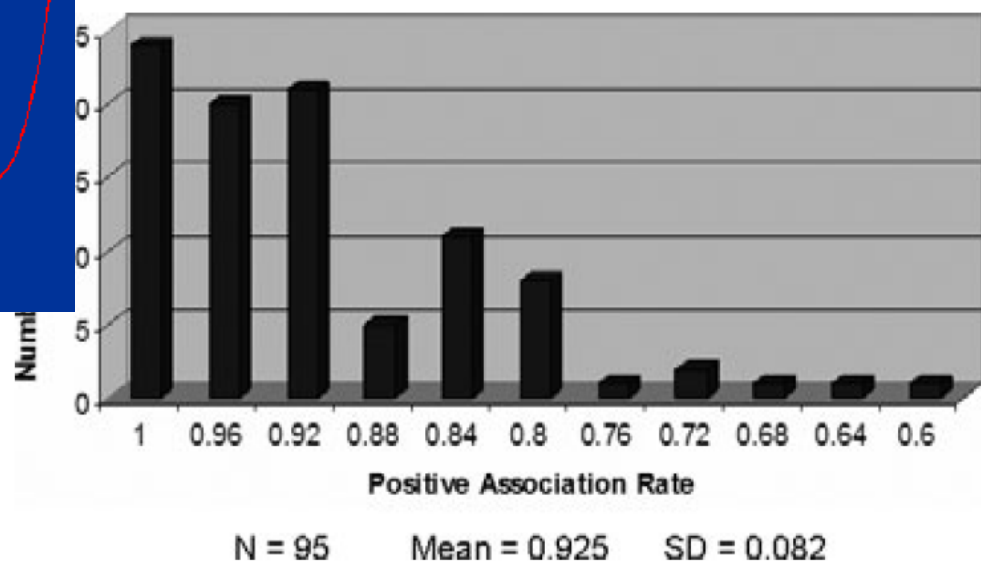

“[T]he court ordinarily should consider the known or potential rate of error...” Daubert.

Mean Value and Uncertainty

$$x' = x_{\text{mean}} \pm u_x @ P\%$$

x_{mean} is a P% probable estimate of x'
with uncertainty u_x

Metrology & Legal Principles

“[T]he court ordinarily should consider...the existence and maintenance of standards” Daubert.

Metrology & Legal Principles

“General acceptance... can be an important factor.” Daubert. Frye.

Metrology

Fundamental Principles of Reasoning

“If the citizens of the State of Washington are to have any confidence in the breath testing program, that program has to have some credence in the scientific community as a whole.”

Traceability

Uncertainty

“While forensic science is distinct from research science some may believe that a lesser standard is acceptable. Such a conclusion would be erroneous...When evidence of measurement relies on inadequate scientific foundation, the proffered evidence must be classified as untrustworthy and inadmissible. To admit bogus and misleading science under the pretext of legitimate science is irrational and harmful to any notion of justice.”

“...the proposition that robust scientific standards are expected in the WSTL still remains.”

ISO 17025
