
Technical Procedure for Processing Hands/Feet of Unknown Deceased

1.0 Purpose – This procedure outlines the suggested methodology for processing the hands/feet of unknown deceased individuals.

2.0 Scope – This procedure applies to the proper handling, processing and examination of severed hands and/or feet (or any part thereof) of an unknown deceased individual.

3.0 Definitions – N/A

4.0 Equipment, Materials and Reagents

4.1 Equipment and Materials

- Appropriate gloves (numerous pairs)
- Face shield visor, surgical mask, and/or safety goggles
- Lab coat or apron
- One (1) or more scalpel handles
- One (1) or more scalpel blades (various sizes)
- Magnetic fingerprint powder
- Magna wand
- Fingerprint ink
- Inking slab
- Postmortem printing spoon
- Fingerprint cards, white paper, acetate and/or HandiPrint paper and clear acetate sheets

4.2 Reagents

- Tissue builder and syringe(s)
- Isopropyl alcohol
- Mild soap/detergent
- 10 % bleach solution

5.0 Procedure

5.1 General Procedure: Although the terms hand(s), finger(s) and palm(s) are used throughout this procedure, the terms foot (feet), toe(s), remains, or sole(s) may be used.

5.1.1 Prepare the processing and examination area by placing clean paper in the Bio-Hood and on the counter space.

5.1.2 Set out all necessary apparatus and supplies.

5.1.3 Wearing, at a minimum, two (2) pairs of protective gloves, protective clothing and surgical mask/face shield, remove the container of remains from refrigeration and place in the sink.

5.1.4 Remove the hands from the container (leave lid, container and any liquid in the sink) and, properly clean the remains, if soiled, using tap water, mild soap, a soft bristled brush and towels.

- 5.1.5 Once clean, allow hands to dry in fume hood.
- 5.1.6 Examine the remains carefully for significant ridge detail. This includes the fingers, joints and palms.
- 5.1.7 If significant ridge detail is present, record it by either the application of printer's ink and then rolling the impression onto white paper or by the application of magnetic fingerprint powder and the use of HandiPrint adhesive paper and clear acetate sheets.

Note: Several attempts may be made to obtain the highest quality fingerprints. Ensure that all impressions are properly marked with the finger/palm from which they originated.

- 5.1.8 If remains are shriveled, but ridge detail is still present, the remains may be soaked in a tray of tap water in an attempt to rehydrate, or a commercial tissue builder may be injected into the fingers or palms using a syringe. Inject tissue builder into the tips of the fingers or the side of the palm so as not to destroy any ridge detail. Inject enough tissue builder to add pliability and restore the finger/palm to the approximate original state.
- 5.1.9 If tissue builder injection or soaking is successful, the remains may then be inked or powdered as described above.
- 5.1.10 If the injection of tissue builder/soaking and ink/powder application is unsuccessful, carefully clean the ink/powder from the remains using a soft-bristled brush and alcohol. Remains may be rinsed and patted dry as needed.
- 5.1.11 Using a scalpel handle and blade, carefully and slowly remove the layers of skin containing ridge detail from each finger/palm in a solid sheet or large pieces.

Note: Ensure each piece of skin is placed in a container and is labeled as to its origin. In some instances, the remains may be in such a state of decomposition that the finger/palm skin may be removed without an attempt first being made to take the impressions with the skin attached to the hands.

- 5.1.12 Each piece of skin shall then be photographed, inked or powdered. The procedure used is based on training and experience of the working Forensic Scientist. If necessary, the skin may be placed over the gloved hand or finger of the Forensic Scientist and ink or powder applied for printing.
- 5.1.13 Prints shall be preserved on a ten-print card, white paper, HandiPrint in conjunction with clear acetate sheets, or by the use of photography. Ensure that all impressions are properly marked.
- 5.1.14 Once impressions are obtained return the hands to the original container and seal. Any additional remains shall be placed in the original container or in separate plastic containers and attached to the original container. Place all sealed containers back in refrigeration.

Note: The method used to obtain impressions from human remains shall be determined by the Forensic Scientist. Each set of remains shall be examined independently and one or more of the methods of printing described above shall be used.

5.2 Standards and Controls - N/A

5.3 Calibration – N/A

5.4 Sampling – N/A

5.5 Calculations – N/A

5.6 Uncertainty of Measurement - N/A

6.0 Limitations – In some cases, the remains may not be suitable for obtaining adequate impressions. The level of decomposition shall dictate whether or not postmortem inked impression may be obtained.

7.0 Safety – Protective gloves, surgical mask/face shield and protective clothing shall be worn. Hands from deceased individuals present the most severe biological hazard of any evidence processed in the Latent Evidence Section. No Forensic Scientist shall process items of human remains while working alone in the Latent Evidence Section. All work on hands shall be performed in the bio-hood.

7.1 Extreme caution shall be exercised to protect yourself and others from infection. Every accident shall be reported to the supervisor immediately.

7.2 Properly discard all used materials in red biohazard bags. Clean all work surfaces and contaminated instruments thoroughly with a 10 % bleach solution.

7.3 Do not eat, drink or smoke while performing this procedure.

7.4 All hands and fingers shall be stored in the refrigerator in a sealed container until needed.
